Stainless Steel
Product Care and Maintenance

Cleaning Products

Use alkaline, alkaline-chlorinated, or non-chloride cleaners designed specifically for use with stainless steel products. Gentle dish detergents are also acceptable.

Avoid cleaners with chlorides or quaternary salts such as bleach or other all-purpose cleaners. These cleaners can attack stainless steel and cause pitting and rusting.

If use of bleach is necessary, thoroughly rinse and wipe down the surface immediately after application. Under no circumstances should hydrochloric acid be used on stainless surfaces.

Directions

Wipe surface with non-abrasive cloth along the visible grain of the steel. Wiping with the grain ensures that no contaminants are caught in the microscopic grooves.

Do not use scouring pads, brushes, or other metallic items, as they will damage the steel.

After wiping down, dry the surface with a soft cloth or paper towel.
